Arrow's Impossibility Theorem

Arrow's Impossibility Theorem (1951)

No scheme for deciding the outcome of a democratic election involving three or more candidates is consistently fair.

Kenneth Arrow

- A method for deciding the outcome of an election is called a **voting scheme**.
- Arrow stated minimum requirements, called **fairness criteria**, which define what it means for a voting scheme to be “consistently fair.”
- Today we'll look at some different voting schemes, and introduce Arrow's fairness criteria as we go.

Preference Ballots

In all our elections, each voter will be asked to fill out a **preference ballot** in which she ranks all the candidates in order of preference.

Ex. Voters were asked,

Who is the greatest R&B singer of all time?

Their choices were Al Green, Beyoncé, Ray Charles, and Diana Ross.

Sample preference ballot:

Ballot	
1st	<i>Diana Ross</i>
2nd	<i>Ray Charles</i>
3rd	<i>Beyoncé</i>
4th	<i>Al Green</i>

There are only a handful of possible ways to fill out the ballot. If we stack identical ballots together, we see that there were only five different ballots in the election.

We can summarize the ballot information with a **preference schedule**, a table which shows how many of each type of ballot there were:

number of voters:	14	10	8	4	1
1st choice	A	C	D	B	C
2nd choice	B	B	C	D	D
3rd choice	C	D	B	C	B
4th choice	D	A	A	A	A

Henceforth, we will give all elections in the form of a preference schedule.

One way to decide the winner of the Math Appreciation Society election is to declare that the winner is the candidate with the most 1st choice votes.

We call this the **plurality method** for deciding the election.

number of voters:	14	10	8	4	1
1st choice	A	C	D	B	C
2nd choice	B	B	C	D	D
3rd choice	C	D	B	C	B

Majority Candidates

A **majority** is more than 50% of the votes.

1824 presidential election

candidate	percent of electoral votes won
 Andrew Jackson	37.9%
John Quincy Adams	32.2%
William Crawford	15.7%
Henry Clay	14.2%

} 62.1%

“The election of Paul LePage with 38% of the vote means Maine’s next governor won’t take office with the support of the majority of voters—a situation that has occurred in six of the last seven gubernatorial elections.”
(*Portland Press Herald*, Nov. 10, 2010)

Majority Criterion

Fairness Criterion #1: The Majority Criterion

A majority candidate (that is, a candidate with more than half of the first-choice votes) should always be the winner.

We say a voting scheme **violates** the Majority Criterion if it is *possible* for a majority candidate to lose the election.

Q: Does the Plurality Method violate the Majority Criterion?

Do you know of any elections in which 2nd-choice, 3rd-choice, etc., votes actually count?

The recipient of the MVP Award in Major League Baseball is chosen by the Baseball Writers Association of America.

- Each member of the Association ranks the candidates from 1st choice to last choice.
- A last-choice ranking is worth 1 point. A next-to-last-choice ranking is worth 2 points, and so on.

 = 4 points

 = 3 points

 = 2 points

 = 1 point

The winner is the candidate with the most *points*.

We call this scheme the **Borda count method**.

The Borda Count Method: Sample election

Suppose that 11 voters choose the recipient of the MVP Award from the four candidates *Abbott*, *Butler*, *Castillo*, and *Davis*.

number of voters:

	6	2	3
1st choice	A	B	C
2nd choice	B	C	D
3rd choice	C	D	B
4th choice	D	A	A

Should Baseball Change its MVP Voting System?

1/7/2014

0 Comments

The

There's something wrong with a voting system where a majority of voters can vote for a candidate, and he can still lose.

The
Majo

By Devin McCarthy and Matt Dewilde

Cabrera vs. Trout / ESPN

Major League Baseball decides its MVP using a ranked-choice system, of sorts. It is a point-based system known as a "Borda count" – a method **already discussed** on this blog in the context of FIFA Ballon D'Or voting. It's a pretty good voting system for baseball, as it allows voters to fully express their MVP preferences without any fear of vote splitting or wasting a vote on a "spoiler" player.

Condorcet Criterion

The plurality method is not a fair voting scheme

The plurality method violates the Condorcet Criterion.

The plurality method violates the Condorcet criterion

Ex. The marching band at Tasmania State University has been invited to perform at five different bowl games: the *Rose Bowl*, the *Hula Bowl*, the *Fiesta Bowl*, the *Sugar Bowl*, and the *Orange Bowl*. The following preference schedule shows the results of an election held among the 100 members of the band, to be decided by the plurality method.

number of voters:	49	48	3
1st choice	<i>R</i>	<i>H</i>	<i>F</i>
2nd choice	<i>H</i>	<i>S</i>	<i>H</i>
3rd choice	<i>F</i>	<i>O</i>	<i>S</i>
4th choice	<i>O</i>	<i>F</i>	<i>O</i>
5th choice	<i>S</i>	<i>R</i>	<i>R</i>

- Is there a Condorcet candidate?
- Who wins the election?

Perhaps it would be best to decide elections on the basis of head-to-head matchups (or **pairwise comparisons**).

To find the winner of an election under the **method of pairwise comparisons**:

- List all the possible pairwise comparisons.
- For each pairwise comparison, give 1 point to the winner, and 0 points to the loser.
- If there is a tie, give each candidate $\frac{1}{2}$ point.

number of voters:	2	6	4	1	1	4	4

Unfortunately, one of the candidates turns out to be ineligible.

We delete the candidate from the preference schedule, and obtain a new preference schedule.

Will this affect the outcome?

- Some municipalities require that a candidate obtain a majority of the first-place votes to be elected. When there are three or more candidates, quite often there is no majority candidate.
- A **run-off election** is typically held at this point: the last place candidate is eliminated from the ballot, and a new election is held.
- The method of **instant runoff voting** (a.k.a. **plurality-with-elimination**) is a more efficient way to implement the same process. This method has become somewhat of a trend in recent years.
- Voters fill out a preference ballot so that they do not need to vote over and over. From the original preference schedule, we eliminate the candidates with the fewest first-place votes one at a time until one of them gets a majority.

■ Round 1.

Count the first-place votes for each candidate. If a candidate has a majority of first-place votes, then that candidate is the winner. Otherwise, eliminate the candidate (or candidates if there is a tie) with the fewest last-place votes.

■ Round 2.

Cross out the names of any candidates eliminated from the preference schedule, and recount the first-place votes. If a candidate has a majority of first-place votes, then that candidate is the winner. Otherwise, eliminate the candidate (or candidates if there is a tie) with the fewest last-place votes.

■ Round 3.

Repeat Round 2 until a winner is found.

Ex. The cities of Athens, Barcelona, and Calgary are competing to be the host city for the 2020 Olympics.

A secret vote of the 29 members of the Executive Council of the International Olympic Committee is to be held.

Two days before the actual election, a *straw poll*¹ is held.

Preference schedule for straw poll

1st choice	A	B	C	A
2nd choice	B	C	A	C
3rd choice	C	A	B	B
number of voters:	7	8	10	4

(It turns out that Calgary wins this straw poll.)

¹ A **straw poll** is an unofficial vote or poll indicating the trend of opinion on a candidate or issue.

When word gets out that Calgary is favored to win the election, the four delegates represented by the rightmost column of the straw poll's preference schedule decide to switch their votes and vote for Calgary first.

Preference schedule for actual election

1st choice	<i>A</i>	<i>B</i>	<i>C</i>
2nd choice	<i>B</i>	<i>C</i>	<i>A</i>
3rd choice	<i>C</i>	<i>A</i>	<i>B</i>
number of voters:	7	8	14

Now who wins?
